

Entity Relationship Diagram

Generated directly from `backend/prisma/schema.prisma` — six tables behind the project/task management platform.

Primary key

Foreign key

Enum type

Join / audit table

italic field = nullable

NOTES

- PROJECT_MEMBER** is a join table between `User` and `Project`, unique on `(projectId, userId)` — a user can only be added to a given project once. Deleting a project or a user cascades to their memberships.
- `Task.assigneeId` is nullable (a task can be unassigned); `Task.creatorId` is required.
- TASK_STATUS_LOG** is append-only — written transactionally alongside every `Task.status` change (`task.service.ts::updateTask`) and forms an audit trail, never updated or deleted directly.
- Deleting a **Project** cascades to its **Tasks** and **PROJECT_MEMBER** rows; deleting a **Task** cascades to its **TASK_STATUS_LOG** and **TASK_COMMENT** rows.
- TASK_COMMENT** access follows the same project-access check used to read a task — any member of the task's project, its manager, or an Admin may read and post comments, not just the task's assignee.
