

Use Case Diagram

Every use case the three roles can perform, grouped by subsystem. Reflects the actual route-level (`authorize( ... )`) and service-level (`assertProjectAccess` / `assertManagerOrAdmin`) checks in the backend — not an aspirational spec.

● Admin

● Project Manager

● Team Member

|

● Full access

○ Scoped (see note)

● No access

01 Authentication	3 use cases			
USE CASE	ADMIN	PM	TM	NOTE
Register / log in	●	●	●	Self-registration always creates a Team Member; Admin promotes roles afterward.
Log out	●	●	●	
View own profile	●	●	●	

02 User Management	5 use cases			
USE CASE	ADMIN	PM	TM	NOTE
Create a user directly	●	●	●	Name / email / password / role in one step — no self-registration needed.
List & view all users	●	●	●	
Change a user's role	●	●	●	
Activate / deactivate a user	●	●	●	Deactivation is enforced at login, not cosmetic.
Permanently delete a user	●	●	●	Blocked (409) if the user manages a project or created tasks/comments; self-delete blocked too.

03 Project Management	4 use cases			
USE CASE	ADMIN	PM	TM	NOTE
Create a project	●	●	●	PM becomes the project's manager automatically.
Edit a project	●	○	●	PM: only projects they manage.
Delete a project	●	○	●	PM: only projects they manage, not ones they're merely a member of.
View projects	●	○	○	Admin: all. PM: managed + member. TM: member only.

04 Team Management	2 use cases			
USE CASE	ADMIN	PM	TM	NOTE
Add member to project	●	○	●	PM: only on projects they manage.
Remove member from project	●	○	●	The project's manager can't be removed as a member.

05 Task Management	7 use cases			
USE CASE	ADMIN	PM	TM	NOTE
Create a task	●	○	●	PM: only in projects they manage; assignee must already be a project member.
Edit any field of a task	●	○	●	TM cannot touch title, priority, or assignee — see status row below.
Delete a task	●	○	●	
View assigned / accessible tasks	●	○	○	TM: tasks assigned to them, via <code>/tasks/my</code> and the dashboard.
Update a task's status	●	●	○	TM: only the status field, only on tasks assigned to them — from the task page or the dashboard.
View task status history	●	○	○	Append-only audit trail, written transactionally on every status change.
Comment on a task	●	○	○	Any member of the task's project — not just the assignee, unlike status updates.

06 Dashboard	1 use case			
USE CASE	ADMIN	PM	TM	NOTE
View role-scoped summary stats	●	●	●	Admin sees user/project/task totals; PM sees their projects/tasks; TM sees their own task counts plus an inline status changer.

NOTES

•

Edit any field of a task vs. Update a task's status: both hit the same `PATCH /tasks/:id` route, but the service layer allow-lists which fields each role may change — a Team Member's request is rejected (403) unless it targets a task assigned to them and only touches `status`.

•

View projects: Admin, PM, and TM all call the same `GET /projects` endpoint; the result set is scoped server-side by `scopeWhere(user)` rather than by separate endpoints per role.

•

A Project Manager can only exercise project/task/member use cases on projects where they are the `managerId` (`assertManagerOrAdmin`) or where they've been added as a member (`assertProjectAccess`) — being a member does not grant edit/delete rights, only the project's own manager (or an Admin) has those.
